

Dashboard Design

Date	21 September 2026
Team ID	MCA
Project Name	Smartphone Addiction Analytics Dashboard
Maximum Marks	5 Marks

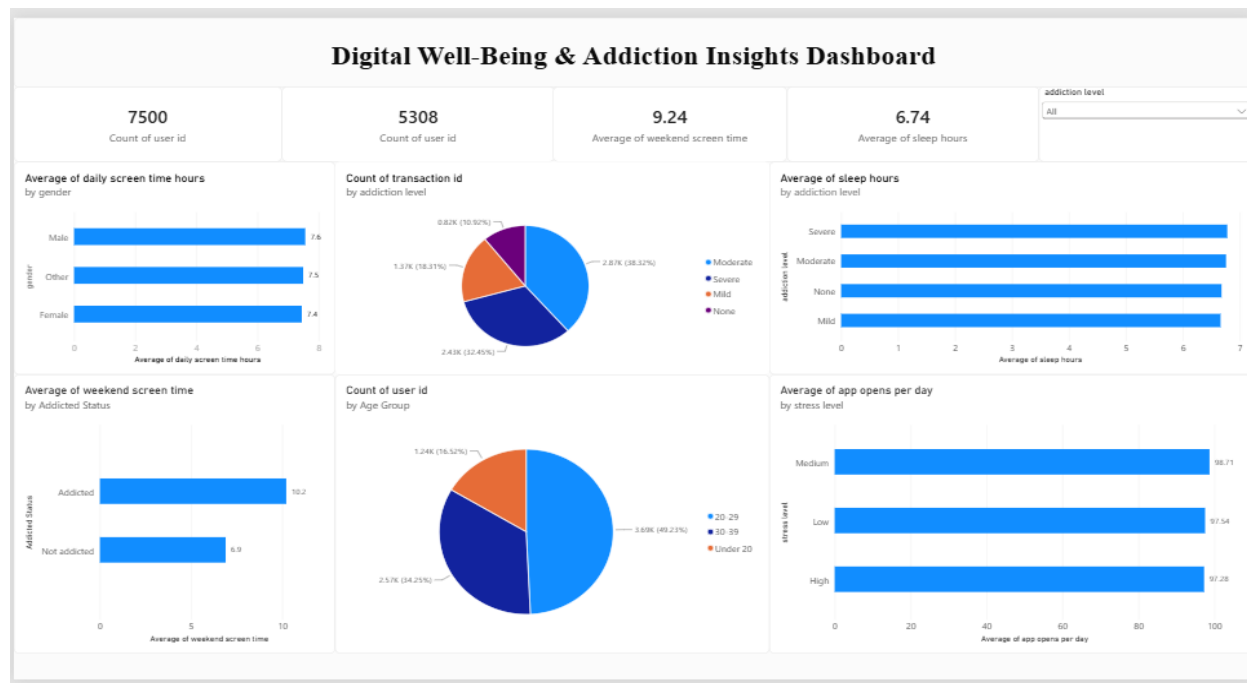

Creating an effective dashboard involves thoughtful design to ensure that the presented information is clear, relevant, and easily understandable for the intended audience. Key principles followed include Clear and Intuitive Layout, Appropriate Visualizations, Colour and Theming, Interactive Filters and Slicers, Drill-Down Capabilities, and Responsive Design.

Activity 1: Interactive and Visually Appealing Dashboard

The Digital Well-Being & Addiction Insights Dashboard has been designed with the following best practices:

- Clear and Intuitive Layout – KPI cards at the top, followed by supporting charts in a clean grid
- Appropriate Visualizations – Bar charts, Pie charts, and horizontal bars chosen based on the nature of the metric
- Colour and Theming – Consistent blue palette for visual harmony and easy interpretation
- Interactive Filters – Addiction Level slicer allows users to filter the entire dashboard
- Drill-Down Capabilities – Charts support interaction for deeper exploration of segments

Major Outcomes from the Dashboard

- Total Users Analysed:** The dashboard covers **7,500 users** (Count of user id), providing a solid sample size for insights.
- High Addiction Prevalence:** **5,308 users** are classified as addicted (addicted_label = 1), indicating that approximately 70.8% of the user base shows signs of addiction.
- Weekend Screen Time:** Average weekend screen time is **9.24 hours**, which is notably high and higher than typical weekday usage for many users.
- Average Sleep Hours:** Users average **6.74 hours** of sleep, which is below the recommended 7–9 hours, suggesting a potential link between high screen time and reduced sleep.
- Gender & Screen Time:** Average daily screen time is very similar across genders (**Male 7.6 hrs, Other 7.5 hrs, Female 7.4 hrs**), showing no major gender disparity in overall usage.
- Addiction Level Distribution:** The pie chart shows **Moderate (~32%), Severe (~18%), Mild (~18%), None (~11%)** (with some missing), confirming that Moderate and Severe together form the majority of labelled users.
- Sleep by Addiction Level:** Severe addiction users have slightly higher average sleep hours than expected, while Mild users show the lowest – indicating complex relationships that need further investigation.
- Weekend Screen Time by Addiction Status:** Addicted users average **10.2 hours** of weekend screen time versus **6.9 hours** for non-addicted users – a clear behavioural differentiator.
- Age Group Distribution:** The largest age segment is **20–29 years (~49%)**, followed by 30–39 and Under 20, showing the dashboard is focused on young adults.

10. App Opens by Stress Level: Average app opens per day are very similar across stress levels (**Medium 98.7, Low 97.5, High 97.3**), suggesting that stress does not strongly differentiate app-opening behaviour in this dataset.
